About solar energy panels

By Peter Lenkefi

What is a solar energy panel?

A solar energy panel collects energy from the sunlight and converts it into direct current (DC) electricity. Two oppositely charged slices of silicon are placed together below a piece of glass and as the protons in the sunlight knock the negatively charged neutrons away from the silicon the electric field created by the two adjoining pieces of silicon attract the neutron. Small pieces of wire catch the neutrons and when they connect they create direct current electricity. The wires connect to an inverter that changes the direct current (DC) into alternating current (AC) that we use in our homes.

Solar panels, known as photovoltaic (literally meaning "electricity from sunlight") are placed on the roof of your house, the roof of your garage or even as stand alone panels in your garden. Government grants are freely available to help pay for the panels and installation so do a little research and find out what you're entitled to.

Domestic uses for solar panels.

A quick glance around your local gardening or home improvement store will show you that the amount and quality of solar powered goods are increasing. Garden lighting, water features and much more are now readily available powered by the sun but there really is so much more that solar power and solar panels can offer. If you've got a swimming pool you can heat that, or you can heat your hot water boiler with only a couple of solar panels or, alternatively, you may be considering powering your entire house with the rays of the sun.

PV roof tiles are not only available but also much more affordable than you probably think. If it's time to replace your roof or you're considering having it retiled for any reason then PV tiles are a much more viable alternative and after a year or two they will have undoubtedly made up the slight increase in cost you may face for the initial purchase and fitting. You need very little room in your house and fitting a grid tie system means you can sell surplus energy to the grid; all in all if you have full roof solar panels you can expect to reduce your annual energy cost by 75% to 100%. That's a big saving, especially if you were only considering solar in order to try and do your bit to save the environment.

About solar energy panels

Can I buy solar panels anywhere?

Most electronics stores and garden or home improvement stores or will stock solar powered goods at the very least; find the right store and they will sell everything you need. If you don't know what you're doing with electronics it is highly advisable that you seek professional guidance, and a quick search on the Internet or a flick through your phone book will find several distributors and fitters of PV tiles and grid tie systems.

Solar Powered Homes Are Becoming More Popular

By Dave Moore

In this day and age of ever growing efficiency, everyday folks are looking to capitalize on today's current technology to save money in all areas of their budget. And since energy prices are getting steeper, and concerns of man-made pollution are on the rise, the choice to retrofit an existing home into a solar powered home is becoming more enticing to the average consumer.

Solar Power use for the everyday homeowner used to be limited to just heating the backyard swimming pool. But these days solar power technology has grown by leaps and bounds. You can now have your entire home be powered by solar energy, including (but not limited to) garden and walkway lights, water heater, interior lighting, attic fans, central air conditioner, and, of course, your swimming pool.

Although the solar powered car is becoming the most popular use for this alternative energy source, the steps to create a solar powered home are not to hard (when using a professional service) and well worth the investment. There are a number of solar power panels and solar power kits available on the market, but if you are interested in solar power to power any part of your house, your best bet is to look up "solar power" in your local phone book.
