Are Diamonds Really Forever?

By Anita Morris

In the past, the Greeks and the Romans thought that the diamonds were tears of Gods and small

pieces of stars. There were also the Hindus, who thought that the diamonds had so much power that they put diamonds in the eyes of some of their statues. Other people believed that an unapproachable valley in Central Asia covered by diamonds existed. One said that this valley was "kept by birds of prey and protected by snakes of mortal stare".

Besides believing that diamonds could attract luck and success, people also thought that they could defy the astrological events. Many people used them as jewels, supposing they would be increasing their sexual power and capacity to attract. Even Plato wrote about diamonds, describing them as living creatures, impersonating divine spirits.

Until the 15th century, only kings were allowed to use diamonds, having them as a symbol of courage, power and invincibility. But as the centuries passed by, the diamond started to acquire its status of sublime proof of love. Currently, they are related to the love, romance and myth.

We probably will never know when the first diamond was discovered, but we do know that, from the ancient times to the 18th century, all the diamonds of the world came from India. >From the period of the Roman Empire to the appearance of the first Europeans to India, in the beginning of the 16th century, the commercial relations between Europe and Eastern Asia bloomed.

One of the main routes of the diamond commerce was in Venice. The city became the most important mercantile republic of the western world. It enjoyed the monopoly of the commerce of the diamond course to the main cities of the south of Germany until its final destiny, Brussels. Since this city became the final phase of the commercial route, it became a promising centre of diamond stature, and the reputation of the city in this sector did not stop increasing. Even though Brussels maintained their predominance until the end of the 14th century, they began to decline in a lapse of fifty years. The diamond trade and numerous other economic activities of Brussels were moved progressively to the city of Ambers, which offered more recent and better facilities for the communications and the commercial exchange. In 1866, the first diamond in South Africa was discovered. Following this was the discovery of the deposits of Kimberley few years later, giving birth to the fabulous era of Kimberley.

Are Diamonds Really Forever?

The word diamond comes from the Greek word ' adamas ', meaning invincible, and ' diaphanes ', that means transparent. In the past centuries, people believed that a diamond could reattach a wrecked marriage. It was used also in battles as a symbol of courage.

Even though the diamond is the hardest rock known by men, it is the only precious gem with only one element: carbon. Nevertheless, it can only be melted when exposed to a temperature of 5500 degrees Celsius! Billions of years before, the basic forces of heat and pressure miraculously transformed the carbon into diamond through volcano lava underneath the earth. In some way, this volcanic mass was expelled out of the earthly crust, cooling soon to be found as diamonds in rudimentary form. No acid can destroy them, and they are capable to cut anything on Earth, therefore, they only can be cut with themselves.

However, are the diamonds really forever? If they appeared miraculously, can they be destroyed? As incredible as it may seem, the small diamond that adorn the ring that you gave your wife will probably last forever – at least while Earth exists. They are the most resistant minerals of the planet, and only can be melted when displayed to a temperature of 5500°C. The problem is that the global atmosphere will never achieve this high temperature, even if it was to be hit by an enormous meteor that would eliminate all forms of life. They only would melt if, one day, the planet literally entered the Sun, which has a temperature of 5800°C. The curious thing is that, according to astronomers, in 7,5 billion years our planet will actually enter the Sun, when the star will be next to death. If you think diamonds will disappear then, you might be wrong. When such episode happens, the temperature of the Sun will lower to about 3000°C. That means that even when Earth reaches an atmosphere as hot and dense as Mercury's atmosphere, we will still be able to find some small diamonds spread around.

Pink Diamonds: A Girl's Best Friend?

By Roger Wembley

I've got a confession to make. I am a man and I like diamonds. I know what you are thinking: that I'm Liberace. Well, no. I'm not Liberace. I don't even play the piano. But I like diamonds just as much as anyone else. However, one of the things I noticed is that online, it is very difficult to find information on pink (and other colored) diamonds.

Let's take a look at a whole bunch of reasons that pink diamonds are considered some of the nicest diamonds on the face of the earth and why people go to extremes to buy them.

1) Rarity. Nothing has really changed all that much in the last 100 years. People still like rare items for the very fact that they are rare. If no one else has something, then people are much likely to want it. Call it attention, call it what you will, but rare items always seem to be much more valuable than plane items. The same holds true with jewelry and pink diamonds are no exception. Pink diamonds are fairly

Are Diamonds Really Forever?

rare items to get a hold of. Pink diamonds are off color: nature doesn't seem make them that often. However, man has altered diamonds, and man made (or man altered) pink diamonds can be found being offered by different jewelers. They won't sell for nearly the price that natural pink diamonds will, but they exist.

2) Style. Pink diamonds have been seen in recent years being sported by J Lo and some of the most famous celebrities in the world. They are definitely in with the in crowd. Given that pink diamonds are in style, you can expect to pay a little bit more for them as well. We don't think that pink diamonds are going to go out of style anytime soon, so if you are shopping for them, don't be surprised to see a high price tag given the amount of celebrities who love them these days.

3) Luxury. Pink diamonds are still diamonds. And people love luxury items as much as they ever did. Pink can stand for luxury. Diamonds spell luxury. The two combine to give quite a fancy name to themselves.

These 3 point are merely introductory: learn how to pros buy pink diamonds. Find out how to do it correctly and save a bundle.
