Arthritis Treatment: Clinical Trials In The US

By Barbara Allan

Improvements in arthritis treatment come from clinical trials. Clinical trials allow researchers to see which arthritis treatments work, which don't work, and how different arthritis treatments compare to each other.

There are currently several clinical trials going on in the United States. They are being conducted by the National Databank (NDB), which is a research databank for the purpose of studying arthritis and rheumatic conditions.

The National Data Bank for Rheumatic Diseases is a world-renowned, non-profit, independent research group. Its mission is to improve rheumatic disorder outcomes and care by providing research information to doctors and to people with arthritis, fibromyalgia, lupus, or other related problems. The NDB has published numerous articles in reputable medical journals.

Every six months more than 10,000 people contribute to this important research by volunteering approximately an hour of their time to answer questions about their condition and how it affects their lives. This is done online or by completing paper questionnaires that they send in the mail.

If you decide to participate in the NDB you'll be making an important contribution to the future of arthritis treatment.

What to Do If You Wish to Participate in the NDB Study

1. Visit the NDB enrollment page: . You'll be asked to provide consent to participate in the research.
2. After consenting, you'll begin the enrollment forms. They will ask for your contact information, your doctor's contact information, and other ways they can reach you if necessary. They may need to contact your doctor to confirm your diagnosis.
3. Then you'll move on to four pages of questions about your condition, which medications you are taking and have taken in the past, and your general state of health.
4. That's it. You're almost done.
5. Look in your email for confirmation of your enrollment.

form, you are now ready to join in the on-going research. They will contact you every 6 months in January and July with an email link to an online questionnaire. Depending on when you signed up, it may be a few months before you receive your first email with the online questionnaire link.

To enroll visit:

<http://www.arthritis-research.org/patients.htm>

BENEFITS The NDB project provides an easy-to-use format which allows you to share your experience, giving researchers information intended to help improve treatments for rheumatic diseases and improve the quality of life for people living with rheumatic disease.

Your participation could help change arthritis treatment for the better. New and more effective arthritis treatment may results from this study.

Cat Arthritis

By Niall Kennedy

Cat arthritis is not a very common ailment among healthy cats. Most arthritis found in cats is from an accident that has made the bones or joints weak. Arthritis is an inflammation of the joints and there is more than one type of arthritis that can affect your cat.

Cats usually suffer with two different types of arthritis. The first one being traumatic arthritis, this is brought on by an injury. It could have been a fight with another animal or even being hit by a car.

Osteoarthritis is when a joint just quits working properly and new bone is growing around the joint. Many older cats have this type of arthritis and can be brought on from numerous accidents including dislocations of their joints or even fractures.

Traumatic arthritis does not usually last but can be very painful, if it is more or less a sprain. But, if it involves a fracture then the pain can last a longer time and may even need surgery to heal the fracture or dislocation.

Arthritis Treatment: Clinical Trials In The US

As in the case of Osteoarthritis the pain is severe and your cat will need some relief from the pain. If your cat is overweight the pain can even be more severe.

Talk with your veterinarian if you do believe that your cat does have a type of cat arthritis. Your cat will enjoy life more and be able to chase those mice again if treatment is regular. It is no fun to play and jump and be a cat when they are in severe pain. The longer your cat sits around in pain the stiffer the joints will become. The pain will then increase with every step they take. Be sure to get the treatment your cat needs so they can enjoy life once again.
