Basics Of Breast Augmentation

By Stephen Kreutzer

Breast augmentation is one of the most sought after plastic surgery procedures. Women of all ages, sizes and walks of life get breast augmentation. For some women the choice is a matter of looking better, for others it may be a way to aid recovery after breast cancer. Whatever the reason it is still surgery. Surgery should always be taken seriously and before undergoing this surgical procedure a women should know as much as they can about it.

Breast augmentation is surgery to enhance or change the size or shape of the breast. Women seeking this procedure are cautioned to understand that it will not solve problems they may be having in their life. Unrealistic expectations regarding breast augmentation can lead a woman to regretting her decision. What breast augmentation can do is help the way you see and feel about yourself.

There was once a lot of media attention directed towards breast implants. Silicone implants were found to be susceptible to leakage which could cause health problems. Today the only approved implants are saline implants. Saline is a natural product already found in the body and leakage, if any, is not threatening. Other concerns, however, are still present with saline as with silicone.

There are always risk with surgery. General risks can range from infection to anesthesia problems. Complications that are specific to breast augmentation include, loss of sensation, problems being able to breastfeed in the future, and hardening of the implant. The most common complications are breast pain and numbness. The most serious complication that can occur are toxic shock syndrome, implants breaking the skin and skin dying.

The long term look at breast augmentation shows that many patients will have a need for at least one additional surgery within 10 years. There have not been studies to indicate how long an implant will last, but it is proven that they can break.

Breast augmentation is an expensive procedure. Most insurance companies do not cover this surgery. It is very important to understand why you want the surgery, what results can be achieved and what long term effects can occur. Reversing the surgery means extra pain and money.

Under The Arm Breast Augmentation

By Jim Glu

Under the arm breast augmentation helps increase the size and shape of the breast. Women undergo this under the arm breast augmentation for several reasons.

The breast augmentation surgery helps make the breast in correct shape with the body and gives self esteem to them. It even reduces the volume of the breast after pregnancy. The breast augmentation enlarges or reshapes the breast, which has lost its original shape due to breast feeding and aging. Under the arm breast augmentation involves the placement of saline behind the breast tissue or under the chest wall. It is similar to the method of breast implantation. But the reasons differ. The women with shapeless breast can readily opt for this method. Before the under the arm breast augmentation, initial consultation must be done with reputed plastic surgeon, certified by the American Society of Plastic Surgeons. They will examine the women's health fully and apply the suitable surgical techniques, according to their health condition.

Women opting for under the arm breast augmentation must explain about the drugs or other medicines she is taking. Most importantly smoking women must tell her surgeon about her smoking habit. Since smoking could delay the process of healing and may result in other complications. Surgeon will choose other alternative. The under arm breast augmentation can give a more positive self image.

The under the arm breast augmentation is done under general anesthesia. A small incision is made under the breast or under the arm and a saline implant is gently inserted under the breast tissue with the help of elastic bra, the breast position is corrected. Initially it will create some discomfort, but it can be controlled with oral medicine. The sutures are removed in 7–12 days.

Normally implants used for under the arm breast augmentation are smooth shelled. It gives a perfect womanly look. Implants can be placed to the patients' wish. It can be placed under the arm endoscope method around the incision of about 3 to 4 centimeter. The under the arm breast augmentation can provide a full, perfect shape to the breast. It is 100 per cent safe. It enhances the feminine curves and increases the self confidence. The cost is affordable and price worthy for the surgery which is going to provide self dignity. Side effects are rare. It can be either swelling or bruising. But, it will decrease within few days. Under the arm breast augmentation is not painful. The patient can perform her routine activity within 3–4 days.
