Bird Feeder Believed To Attract More Than Birds

By John H. Rogers

Just as the name implies, a bird feeder is a device that is placed outdoors for the purpose of dispensing food to birds. The ultimate success of a bird feeder is determined by it's placement, the types of seeds provided and the design of the feeder itself.

To begin with, a bird feeder must be large enough to accommodate the nearby species. Birds need to be able to get to the seeds easily if they are to continue to use the bird feeder. In addition, the feeder should be placed somewhere convenient and easily accessible. Most bird feeders are located in a tree that birds are known to frequent.

The type of bird that you wish to attract will ultimately determine the type of food that you supply in the bird feeder. For example, while most food is made in the form of seeds, hummingbirds prefer liquid nourishment. This is a very important distinction as bird feeders are created for birdwatching and, without the proper food, there may not be any birds to watch.

Many people around the world enjoy birdwatching and some even record their experiences on video. Some individuals use webcams, while others use a regular camcorder to capture their birds on film. Don't be surprised, however, if you happen to capture a squirrel on video. These little creatures are famous for helping themselves to the contents of a bird feeder and not even so much to eat the food, but rather to carry it away and store it elsewhere. There are, however, a number of bird feeder manufacturers that create their products with the hope of deterring squirrels from swiping all of the seeds. This may include a collapsible bird feeder if anything heavier than a bird should begin to feed or one that provides a slight shock or spins to throw the squirrel a short distance away.

A bird feeder is easy to find at any retail or online store, but the many choices available may make the decision a difficult one. Ultimately, the size of the feeder and it's design will be the most important consideration.

Often, the most effective way of keeping a squirrel away from a bird feeder is to set out a squirrel feeder. Corn and berries are among the foods that may interest a squirrel and may keep him/her occupied so as to not disturb the bird feeder. These creatures, themselves, can add quite a lot of

Bird Feeder Believed To Attract More Than Birds

amusement and birds may find themselves sharing the spotlight as many birdwatchers turn toward watching squirrels, as well.

Bird House Buying Tips

By William Teleo

All bird houses sold on the market are not suitable to birds. These bird houses will not attract any birds and are detrimental to the bird's health. Please make sure you read the following tips and use them when you buy that bird house:

1. **Dimensions:** Different birds need different sizes of bird houses. Depending on the birds you want to keep check the area inside, the size of the entrance hole and the ground clearance of the hole. These are very important to attract suitable birds.
2. **Ventilation and Sanitation:** Make sure the bird house is well ventilated so that it does not heat up too much in summers. Also check the sanitation and drainage holes to make sure that the baby birds do not drown.
3. **Access:** The insides of the bird house should be easily accessible so that you can inspect and monitor the nests. One side of the bird house should be hinged and easy to open.
4. **Construction:** The bird house should be properly constructed with non-toxic material. It should also be properly insulated with unpainted wooden board to keep out the cold and heat. If painted, the paint should be non-toxic.
5. **Other Precautions:** The entrance hole should be shaded by a roof extension to keep out the rain. No perches should be kept outside the entrance hole as it will encourage predators.

Bird Feeder tips

Before embarking upon a mission to buy a bird feeder, it is important that you assimilate knowledge on what kind of foods the bird you want to attract eats and the plants that attract it. Accumulation of some knowledge about the species of birds that frequent area would also help immensely. Placing the attractive plants in the garden along with the bird feeder will increase your chances of attracting the bird. Be ready to accept that the birds frequenting may not eat from your feeder but may feed on the insects and fruits of the plants you have placed for some time.

Bird Feeder Believed To Attract More Than Birds

The most important factor of using a bird feeder is that the feeder should be placed in the same position for a long period of time and it should be regularly filled with food like clock work. Birds are creatures of habit and when they find food in your bird feeder, they will return regularly to it. If they do not find food there, they will move on to greener pastures.

Bird Feeders are of various kinds. The most common is the "Hopper" feeder. This feeder is built with a platform along with walls and a roof so that the food is protected from rain and wind. Always make sure the bird seed never gets wet, since it would drive the birds away. The "tube" feeder is a transparent tube of plastic or glass designed to feed many birds at the same time. The "platform" feeder is a tray on which the bird seed can be placed. These feeders are incapable of protection from predators, squirrels and the natural elements. Some squirrel proof feeders are also available.

Make sure the bird housing and bird feeders are always cleaned regularly.
