Conditions Associated With Infertility In Man

By Low Jeremy

In the past, we were made to believe that infertility is a condition that only occurs in female. But the recent science casts more enlightenment on myths that were thought to be facts, we now know for certain that infertility obviously appears even in the male patients.

In fact, we are to examine the recorded cases of infertility, details will show us that factors of infertility is divided almost equally among female and male factors. These constituting factors take 30% and another 30% are covered by the shared factors which itself covers the unknown infertility conditions.

Depending on the problems that the patient presents, treatments will vary largely from medications to extensive case analysis that may incur surgeries and operations on the affected areas.

Say for example erectile dysfunction, the only obvious clinical representation for which one may base the diagnosis of the condition. (Note: Infertility is not a physical condition and most symptoms are only shade of a far greater problem that resides inside the male's body.).

Erectile dysfunction can be readily treated with medications. But with more advanced signs of infertility in man, the ultimate treatment may lead both the patient and the physician to using assisted reproduction technologies which do not only address male factors causing infertility but may also help treat female infertility.

Normally, in several types of assisted reproduction technologies, male patients are asked to produce semen from which the sperm cells are gathered. There are many factors that will lead the techniques to either its success or its failure. One of which is the semen quality.

If the semen quality is workable for in-vitro fertilization (a form of assisted reproduction technology), it can fertilize along with female egg cells. This would commence all other methods that will follow after the semen and egg retrieval.

However, if the semen has overly low quality, it would be possible that the patients will be asked if they would want to adopt sperms from donors. If not, the procedure won't continue at all. If they would

agree then the cycle will be limited to the egg cell from the partner and sperm cells from another person.

Unfortunately, there exists no technology that will help increase the quality of the sperm cells of a specific person. The only thing that the medical science can do is to make the most out of the present condition the sperm quality may offer.

Infertility Treatments

By I Henman

Infertility is on the rise. The couples who face this problem seek infertility treatments to overcome the issue. When is a couple thought to have pregnancy problems? When they have had unprotected sex for more than a year and yet, there has been no pregnancy. Such couples seek infertility treatments to have pregnancy artificially. With medical science making rapid strides, infertility treatments have developed over the last few years. Steps taken in this respect have yielded positive results for many who want to have kids. However the problem is, a single attempt may not give the results desired and so they have to try on. But this is costly and the bills can go up to the thousands of dollars. The costs for IVF or vitro fertilization and gamete intra-fallopian transfer or GIFT can be as high as \$8,000 to 10,000 for each try. Without insurance, this becomes a pain. However just a few states cover infertility treatments under insurance and thus in most cases, couples need to self-finance. Some desperate couples even take out a second mortgages on their homes to have the necessary funds for infertility treatments.

A couple seeking medical advice usually starts off by wanting to know who has the problem and the exact nature of such problem. Such concerns are easily answered by a few simple tests. There can be minor problems such as a hormone imbalance in case of the woman. These problems are easily checked and treated. For the man, the first check is to ensure that the sperm count is adequate. Because if it is not, then not enough sperms are reaching out to the ovary to impregnate the egg cells. In cases where these tests give no negative results, the couple needs to consult the specialist for infertility treatments. While there are complicated methods undertaken, but that is not the case always. Simple hormone treatments and/or surgery can do the trick.

The couples who need further infertility treatments need to do some thought and research work. Remember this is costly business so better be sure. Get to know more on the infertility clinic, the reproductive endocrinologists, the clinic's success rate for the procedures, and the costs involved. Find out whether there are any insurance plans that are offered and accepted. Get details on what exactly is included and what is not in the costs. Infertility treatments start from a cycle usually, but there are exceptions as well. For people who are desperate for kids and have pregnancy problems, infertility treatments are the best option, but mind it, the results are never guaranteed. So in spite of the steep

costs, many opt for infertility treatments as a last resort.
