Deer-proof Garden

By Jena Luthovski

Life can be beautiful on farmland that stretches what may seem life for infinity. Acre after acre after

acre and land separates you from the hustle and stress of the big city. However, you still have a problem that doesn't normally exist in metropolis. Usually in the serenity and peaceful quiet that doesn't normally exist in metropolis. Usually in the serenity and peaceful quiet of the farmland in the rural American heartland, lives resident deer. Whether it's the buck, doe, yearlings or even fawns, once deer become accustomed to the garden of your home as they suck up its seeds, it's nearly impossible to get rid of them without threatening them or other safer remedies.

The plant species that are most attractive to deer are hostas, phlox and day lilies. Those are only three among many. A decorative fence that surrounds the food garden is usually not high enough to keep the deer out. Fortunately, there are ways to rectify that shortcoming. Regular spraying with liquid fence is a good start, but there are other effective ways for deer proofing.

Gardens are very unique because they are generally our own antidote to civilization, like Club Med without the guests, service representative and costs. Women and men have the opportunity to cultivate new beauty and life as they find solitude with mother nature. The outside world slowly dissolves as we work the soil, compost, weed, till and toil until we fill our inner-selves with the aroma of God's green earth. However, our covenant with the earth and green slowly becomes amiss. Plants are missing and getting damaged. The damage subsequently worsens before there's total destruction to all the hard work that you put into your garden. The culprit is usually that historical mascot of rural living known as deer.

Usually with just survival and reproduction in mind, deer are neither malicious nor benevolent. They are only animals with an incessant appetite for tulips and yews among many plants that grow in your garden. Fortunately, there are many methods of keeping deer away from your good garden creations.

Although it's difficult to pinpoint a sure-fire way to repel deer from your garden, there are a few tricks of the trade. Once you design a food garden to sidestep deer damage, important considerations like the overall appearance and purpose of your garden don't change. However, you can still accomplish your goals in several ways.

Deer Repellants For Your Garden

By Jena Luthowski

Deer, which includes yearlings, fawns, doe and the buck, make it their habit to become a thorn at the side of gardeners all across the nation. Plant species such as phlox, day-lilies, and hostas are examples of what attracts deer to our gardens. Unfortunately, no matter how decorative a fence around the garden is, most fences are not high enough to keep out deer. However, most gardeners can breathe easily when they find successful methods for repelling deer.

The more that plants become missing and are getting damaged, the more that the damage eventually worsens before there's total destruction. This is after all the hard work that you put into your garden. The deer is persistent as well as consistent when it comes to feeding from your lovely garden. It's almost impossible to get of them forever, but there are several ways for the green-thumb gardener to repel a deer from the outdoor garden.

1. There has to be at least one plant substitute that deer loathe. Hybrid tea roses as well as thorny canes, an intense scent, leathery leaves and a propensity to go sprawling into certain barriers combine to create several rugosa hybrids that are practically deer-proof.
2. Deer normally find the entry to your landscape the same way all the time. It's advisable to assure that deer discover the entryway to your garden undesirable. This is not only a good place to focus on deer-repelling plants, but to utilize the repellants as well as other deterrents. Deer often stays with the beaten path, so moving susceptible plants away from deer's traffic areas may be all it takes to save your tulips and daylilies.
3. You can line your territory with repellent and unpalatable plants. It's a good chance that the deer will stay with their territory and bypass your no-longer-a-temptation property.
4. Deer won't consume what they can't discover. A combination of plants with strong aroma interspersed throughout the landscape confuses the deer's sharpest radar for discovering favorite

Deer-proof Garden

foods.

5. Camouflage the smaller plants with deterrent aids. More overwhelming plants, like shrubs and young trees, can be fortified by surrounding them with companions of an unappetizing variety. Just make sure your trees receive enough sunlight for the proper growth.

6. Create a deer obstacle from a garden border using boxwood or solid rugosa rose hedges. Trellises swathed within morning glories are another alternative. Deer won't dare to venture past what they can't see over or through.

Normally, with just survival and reproduction in its mind, deer are neither malicious nor benevolent creatures.
