Diabeticine And Diamaxol: The FDA And Diabetes Medication

By Vivian L. Brennan

You might be wondering about Diabeticine, which has recently changed its name to Diamaxol.

Diabeticine claimed to cure "99 % of type II diabetes, and 64% of type I diabetes." It was approved as a supplement by the Food and Drug Administration (FDA).

Diabeticine, however, claimed to target the root of diabetes. Diabeticine claimed that it was a hypoglycemic agent. The FDA looked at Diabeticine's advertising campaign and declared that it was a drug, not a supplement. This seems to be fair reasoning on the part of the FDA. (The name, Diabeticine, also implies that it is a medicine).

There appears to be mixed feelings about Diabeticine (now Diamaxol). Some people praise it for lowering their blood sugar, without them having to change their diet or exercise. Others claim that taking a pill is not the solution to managing diabetes and that lifestyle changes are the only truly healthy way to maintain the sought blood sugar levels. Those who laud the drug sometimes claim that they have tried diet, exercise, and even other diabetes medicines, but that they were not effective.

Online testimonials generally support Diabeticine, though there are also some testimonials that claim Diamaxol and Diabeticine do not work. A major complaint is that Diabeticine and Diamaxol are too expensive. There are generic options with the same ingredients.

Diamaxol is licensed as a supplement by the FDA. As such, it cannot claim to cure diseases. Diamaxol still claims to lower blood sugar, just like Diabeticine. Diamaxol has a 30 day 50 point lower guarantee, as well as a long term one year claim.

Diamaxol has the same ingredients as Diabeticine, and it claims to be all-natural. A partial list of the ingredients, according to the manufacturer includes Bitter Melon, Licorice extract, Cinnamon herb powder, Yarrow, Cayenne, Juniper Berries, Huckleberry, and Vanadyl Sulfate.

The bottom line is that the helpful effects of Diamaxol are as yet unproven. Though the manufacturer claims to have clinical proof, many sceptics dismiss this as marketing. Because the FDA has approved Diamaxol as a supplement, at least we know that it can't hurt. If you have tried all of your other options,

consider this one, but only after talking with your health care team

Where To Get Diabetes Supplies

By Matt Shupe

Diabetes has slowly crept into the lives of almost eleven million Americans who have diabetes and are aware they have the illness, and up to seven million Americans who are not aware they have diabetes. Added to this glaring number of diabetes-stricken Americans are the millions more who are in the prediabetes stage.

People with diabetes have more chances of surviving the illness if they know how to manage diabetes and they have the financial means to support the medication and other supplies required by people with diabetes.

Getting Type 1 diabetes is usually dependent on you genes although it is not a very strong risk factor. Obesity and age are however risk factors in getting Type 2 diabetes. But no matter how old you are, if you are obese and have a history of gestational diabetes, have one or both parents with Type 2 diabetes or high blood pressure, then it is best to have yourself checked for diabetes.

Type 1 diabetes is commonly found in children while Type 1.5 diabetes is the name given to diabetes found in adults. Adults with Type 1.5 diabetes is characterized by a slower attack on the beta cells compared to the vicious attack of beta cells in children with Type 1 diabetes. In Type 2 diabetes, the body's insulin cannot control its blood sugar levels.

There are several ways of testing for diabetes including the glucose test which measures the blood's glucose level and the oral glucose test. The glucose test is best done after at least 12 hours of fasting.

The main concern for people with diabetes is how to control the level of their blood glucose in such a way that they can lessen diabetes-related complications. Thus, monitoring of one's blood glucose level is always a must for people with diabetes. Controlling the blood glucose level means choosing the type of food you eat and taking the proper medication.

A person who wants to be in control of his diabetes should have all the necessary supplies on hand whether he stays in the house or he travels. A diabetic should always make sure that his insulin supply is not exposed to extreme changes in temperature. A diabetic is also more prone to foot problems so

he should take care of his feet by using comfortable socks.

Other important supplies for diabetics include blood glucose monitors, blood pressure monitors, glucose tablets and gels.

If you have diabetes, make sure that you have your supplies wherever you go. Also inform your housemates or officemates about the possible stores where they can buy these supplies in case you have an emergency. Always scout for stores that sell supplies for diabetics near your home or office or where you frequently go. And if you have to travel, make sure you carry more than enough because you never know what might happen. Also check if the places you will go to have some shops which sell the supplies you need.
