Get Growth From Your Plants

By Denton Krypps

Have you experienced the frustration trying to grow plants that never grow? If you have, there may be some things to consider before you attempt to see growth happen again.

A first thing to considering as you try to plant seeds and see their growth is the location. Where will you grow the plants? What are the conditions of that area? If you attempt to grow plants outside, what is it like? If you are hoping to achieve plant growth inside, what kind of environment are you using for the growing? Be sure that you understand how wet, dry, sunny or cloudy your chosen areas are. Having a correct picture of these things will save you time and money as you begin to look for the right kinds of seeds and plants to experiment with.

It is important not only that you understand the environment in which you hope to see growth from your plants, but it is also important to choose the right kinds of seeds to plant. You must be careful to match a proper kind of seed with your environment. If you live somewhere that is dry and hot most of the time you should choose seeds that require a dry heat for maximum growth. Other varieties of plants will grow better in areas that are sunny but wet, and still others will have maximum growth in areas that are cool and wet. So learn your growth environment well and then choose plants wisely and accordingly. You will not see proper growth happen from even the best, most expensive varieties of plants if you have chosen a seed that does not match your growing environment.

Once you have determined the kinds of environments you have and you have selected the right kinds of seeds to plant you can begin the process of planting the seeds. Take some time to research this process. Are there particular kinds of soils that will bring growth quicker than others? Is there a plant food that will promote growth for your chosen varieties? These are important things to know. How much water does your plant require for healthy growth? Over or under watering a plant can quickly be

the death of it.

Is this process sounding more complicated than you thought it would be? Take heart, you are almost on your way to seeing amazing growth from every seed you plant. The most important steps, if done properly, will almost ensure the results you are hoping for. Perhaps your best bet is to pick up a book on growth and planting from your library or from a friend. Learn as much as you can and then enjoy. Maybe you will want to start with some cheaper seeds first so that you can practice doing everything necessary for their growth before you spend too much money. Whatever you decide, just have fun. Determine the right environment for growth, pick the right seeds, then treat your seeds with the individual care they need. In no time you will be surrounded by a wealth of beautiful plants and flowers.

An avid gardener, Denton Krypps enjoys advising other people with tips and techniques for getting growth that makes the perfect landscape. Find out more at

Cultivating Plants in your Garden...what to watch out for.

By Mike Yeager

There are so many plants available for you to choose from that it's hard to know where to start. Are you looking for house plants, tropical plants or some beautiful garden plants? Green plants are not only beautiful to look at they also provide a much needed source of fresh oxygen for our breathing. Nature has a way of providing a balance for everything.

Different plants grow in different ways. Some plants, send out long underground stems that produce new plants, often at considerable distances from the original plant. These plants can form enormous colonies of new plants within just a couple of years. The leaves of some plants produce buds at their edges, which then develop into miniature plants that fall off and take root. Specialists in the fields of agriculture and horticulture take advantage of the regenerative ability of plants to produce new varieties of plants.

Indoor plants allow you to cultivate, enjoy and fuss over their growth and development with worrying about the vagaries of the weather. Indoor plants are also a way to start new growths and give them a better chance of survival. A rewarding and tasty plant to grow are strawberry plants. These can be easily cultivated and expanded so that every summer you can enjoy your own fresh strawberries right out of your own garden.

Unfortunately many plants have natural enemies that attach themselves to the plant. These can be aphids, moss and fungus. It's vital to keep on top of these enemies to your plant.

Take your time and give some thought to what type of plants your looking for and I'm sure you'll be pleased as you see your plant grow and develop.
