Getting To The Truth About Nail Fungus

By Heather Colman

Nail fungus is something most people know very little about. We may see a few different

advertisements or commercials about nail fungus treatment and prevention, but we really do not know what nail fungus actually is. Nail fungus is a fungal infection of the nail also known as onychomycosis in the medical world.

Studies show that while nail fungus is a common occurrence, it will typically infect the toenails. Very seldom will nail fungus attack the fingernails. Further studies show that approximately twelve percent of the U.S. population has some sort of nail fungus and it is typical with age. People aged 40 and older are the most susceptible to nail fungus. Like many other forms of affliction, nail fungus is hereditary; it seems to run in families. Some others may be more susceptible to nail fungus as well such as those who have a suppressed immune system due to certain diseases or treatments. People who have been diagnosed with AIDS, have received transplants, are undergoing cancer treatments are at risk.

In order to determine if you have nail fungus, you must make an appointment with a dermatologist. They will scrape your infected nail and submit it for microscopic examination. The nail will be carefully examined with a microscope and, occasionally, cultured, to determine what type of fungus is growing in the nail. Your dermatologist will determine if you have nail fungus and which type you have. Dermatophytes are nail fungus found in the toenails. Yeast is the type of nail fungus found in the fingernails.

If your dermatologist has diagnosed either type of nail fungus, he or she will prescribe one of many varieties of treatments available to combat the infection. In treatment of nail fungus, there are prescriptions such as gels, creams, and lotions that may be affective in treating mild cases of nail fungus. For particularly harsh cases, your dermatologist may prescribe oral medication to clear the problem. In extreme cases, the doctor may remove the nail, either the section that is infected or the entire nail to assist in treatment of the nail fungus.

The good news about nail fungus is, if you do get it, it can be treated fairly quickly. There are also steps you can take to avoid getting the infection or avoid getting it again. Talk to your dermatologist, he or she will provide you with the necessary information you need about nail fungus and how you can

prevent it.

Leucatin Believed To Aid In Natural Treatment Of Nail Fungus

By Vincent Abrugar

Leucatin is a natural product that is said to instantly begin fighting against nail fungus. In addition to ridding the current infection, Leucatin is also believed to help prevent the fungus from spreading to other areas. This product contains all natural ingredients and is commonly available as both a capsule and spray, which are used together in order to effectively aid in the removal of nail fungus.

Leucatin is designed to eliminate the nail fungus infection in seven days. According to experts, nail fungus is very difficult to treat and may require an aggressive regimen in order to effectively rid the system of an infection. Leucatin, because it is both a capsule and a spray that is applied directly to the infected area, is said to aid in the complete removal from the inside out.

The Leucatin spray solution was manufactured with the intent of enabling a product to actually go beneath the surface of the nail and begin eliminating the infection and preventing it from spreading to neighboring nails. This is a larger problem among the toenail area, which is often confined to socks and shoes with increased bacteria buildup. When the foot is confined to this type of area, the nail fungus may be able to spread easier. The Leucatin solution is said to help thin out nails that have been thickened as a result of fungus and also remove the discoloration that is often associated with the infection.

While Leucatin is believed to aid in the removal of nail fungus within one week, the actual nail will need time to heal and regenerate in order to look healthy and shiny. This may take some time, the length of which will be determined by the severity of the nail fungus infection itself. If a more advanced condition was present, it may take longer for the nail to regain it's natural beauty. Leucatin is not designed to restore the look of the nail, but rather to remove the infection that will allow the nail to regenerate itself.

It is important to realize what any medication, including Leucatin, is and is not capable of accomplishing. There is no miracle cure for nail fungus that will eliminate all signs of it's existence, but there are products, such as Leucatin, that have been shown to remove the actual fungus that has invaded the nail. Eliminating the infection is the first, and most important, step in regaining a healthy, pain-free nail.
