## Hair Transplant Techniques

By Keith George

People are always conscious of their appearance. No one prefers a bald head so modern

technology has introduced different methods of hair transplant. The success of hair transplant surgery depends upon the type of hair transplantation procedure one adopts during hair restoration surgery.

Gradually hair transplant has taken a new turn in the span of time with single follicular hair being the standard unit of hair transplant surgery. The hair transplant procedure has now become standardized. A long strip of hair transplant starts with the harvesting of donor's hair. It begins with the excision of 1cm and 20cm long strip of hair from donor site. The strip is tapering at end to facilitate easy removal.

The dissection of strips is the next step. After the strip is excised from the donor site it is handed over to the surgical assistants. Then he cuts the strip into many fine strips with the use of stereoscopic microscope. This process of transplantation of donor strips into many strips is technology termed as silvering.

Earlier most of the hair restoration surgeons used to take help of multi blade knife for cutting the strip into silvers. However after the introduction of stereoscopic dissection of microscope the use of single blade has gained much acceptance. After the completion of slicing of strips, the next hair transplant procedure consists of dissecting of these silvers into categories of grafts again with the use of dissection microscope.

In case of dissection of one-haired follicular unit it is called follicular unit graft, in case of two-haired it is called micro-graft, in case of three haired follicular units it is called mini-graft.

Making slits on the recipient site is the next procedure after micro-grafts and mini-grafts and follicular unit. This is one of the most important procedures. The natural direction of the hair plays an important role in the surgery. The size of the slit is also of immense importance. The size of slit and size of graft to be transplanted should be same. Different sizes of blades are used for different kinds and sizes of follicular units and groups of follicles.

## Hair Transplant Techniques

Laser hair transplant is another method. It has proved to give much natural results. In this process a laser beam is used to vaporize a narrow slot in scalp for implanting hair graft. It is capable of transplanting hundreds of graft dramatically and thus also reduces the time of hair transplant surgery.

### **Hair Replacement - 10 Things You Need To Know When Considering A Hair Replacement**

**By Paton Jackson**

Hair replacement is becoming more and more popular in the recent years among people who suffer from hair loss. Due to the advance of medical technology, hair replacement became more common - its prices got more reasonable and its outcome got better.

If you consider having a hair replacement, read the following first:

1. Permanent hair transplant surgery is not new. Actually, the first hair transplant surgery was held over 30 years ago.
2. Hair replacement transplant uses only your existing hair. That's why in order to get a hair replacement transplant you must have hair in good condition at the sides and at the back of your head ("The donor areas")
3. If you have almost no hair left over your head, hair replacement could not help you. There are different techniques of hair replacement transplant according to the ratio of hair fullness required.
4. Hair replacement is not only for men - It could be a good solution for female hair loss in some cases.
5. Hair replacement surgery is usually safe and has no side effects. However, in some cases there could be infections like any surgery.
6. Hair replacement surgery is normally performed using a local anesthesia; you should little or no pain at all.
7. Hair replacement process requires several sessions with an interval of a couple of months between them. All the process can take up to two years.
8. You will be asked to refrain of any sport activity after each hair replacement session.

## Hair Transplant Techniques

9. Make sure that your physician has performed a lot of hair replacement processes and that he knows and has an experience using all the different techniques.

10. Hair replacement is a completely individual process. You must ask the physician how your hair will look after the process.

Hair replacement is a legitimate hair loss solution. However, it is an extreme one. We strongly advice you try other hair loss solution before trying this one.

911 Corp. executed an independent research to find the best hairloss solutions. Find out all about the results and other hair loss information on
