## How Hair Transplant Replacement Works

By Kathryn Whittaker

Hair transplantation - "hair transplant" — is a surgical procedure that involves moving sections of scalp where hair still grows to a part of the scalp that is bald or where the hair is thinning.

### History of hair transplantation

Hair restoration started in 1930, when Japanese doctors experimented to see if skin and hair could be transplanted from healthy parts of the body to parts that had been disfigured by injury.

In 1950, dermatologist Norman Orentreich wrote an article explaining how hair transplantation could be done. Although his studies were not embraced by the scientific community, he became even more determined to prove his theory "donor dominance," which states that even when hair is relocated to a bald area it will continue to grow as it did before. He is considered the father of hair transplants.

Hair transplantation is the most common elective surgery among men. The reason for its popularity among men is the fact that results gained from this procedure are much better compared to other similar hair replacement procedures. The hair transplantation of today is not really different from the hair transplantation Dr. Orentreich performed — however, today's hair transplantation involves graft or plug size.

The older method of hair transplantation is easily identified by its patchy appearance. This used to be the norm, until transplant surgeons critically examined the possibilities of using a different graft size. It was determined that better results would be gleaned from using grafts that were smaller.

### What happens during a hair transplant?

As mentioned earlier, hair transplantation involves moving small pieces of scalp where hair still grows to a part of the scalp that is bald or where the hair is thinning.

There are five types of grafts, varying in size and shape. These are: punch grafts, mini-grafts, micro-grafts, slit grafts and strip grafts. Since this new method of hair transplantation makes use of

## How Hair Transplant Replacement Works

smaller sizes of grafts, many surgical procedures are needed to fully covered a bald area, taking as long as two years. The number of large plugs transplanted during the first sessions of surgery varies with each individual, but the average is usually about 50. With mini-graphs or micro-graphs there may be up tp 700 plugs transplanted per session.

For more information on hair transplantation, ask your surgeon.

### **Hair Replacement - 10 Things You Need To Know When Considering A Hair Replacement**

**By Paton Jackson**

Hair replacement is becoming more and more popular in the recent years among people who suffer from hair loss. Due to the advance of medical technology, hair replacement became more common - its prices got more reasonable and its outcome got better.

If you consider having a hair replacement, read the following first:

1. Permanent hair transplant surgery is not new. Actually, the first hair transplant surgery was held over 30 years ago.
2. Hair replacement transplant uses only your existing hair. That's why in order to get a hair replacement transplant you must have hair in good condition at the sides and at the back of your head ("The donor areas")
3. If you have almost no hair left over your head, hair replacement could not help you. There are different techniques of hair replacement transplant according to the ratio of hair fullness required.
4. Hair replacement is not only for men - It could be a good solution for female hair loss in some cases.
5. Hair replacement surgery is usually safe and has no side effects. However, in some cases there could be infections like any surgery.
6. Hair replacement surgery is normally performed using a local anesthesia; you should little or no pain at all.

## How Hair Transplant Replacement Works

7. Hair replacement process requires several sessions with an interval of a couple of months between them. All the process can take up to two years.
8. You will be asked to refrain of any sport activity after each hair replacement session.
9. Make sure that your physician has performed a lot of hair replacement processes and that he knows and has an experience using all the different techniques.
10. Hair replacement is a completely individual process. You must ask the physician how your hair will look after the process.

Hair replacement is a legitimate hair loss solution. However, it is an extreme one. We strongly advice you try other hair loss solution before trying this one.
