**Keloids prevention and new researches**

**By Martha Fitzharris**

Gone are the days when ear piercing was considered as an effeminate ritual. Today's fashion seems to be transforming the way ear piercing is perceived. This should not come as a surprise because ear piercing is a universal practice even during the primitive times.

An article published in a scientific magazine indicates that individuals who were ear-pierced before the age of 11 showed low chances of developing keloids. A keloid is a kind of scar characterized by a formation of thick, red-brown fibrous tissue at the site of injury. The difference with a normal scar is that keloids are highly pigmented and are slightly raised while normal scar tissues aren't.

Constructing age categories provides valuable details about the rate of keloid development among ear-pierced individuals. A predictable trend in keloid growth was documented on the following age groups: 1 to 10, 11 to 18 and 19 above. 22.2% among children who had their ear-pierced between age 1 and 10 developed such blemishes, while the figure increases as the age advance. Those who have undergone ear-piercing between 11 and 18 shows a dramatic 83.3% increase in scar tissue development. An irregular figure of 66.7% turnout appears on subjects who were at least 19 years of age and 25% for infants during which ear piercing was conducted.

Although some observations remain inconclusive, it can be assumed that the earlier the incision was made, the more that the body is able to cope up with the damage and restructure the proteins that were displaced and restore its previous physical appearance.

The reason for this fast healing process is that young people have young skin cells that actively replace the old and damaged ones at a more rapid pace than an old person. As people mature, there seems to be a slower Elastin and collagen fiber output in their skin. That's why scars and other skin blemishes brought about by injury or accidents becomes even more prominent at old age, since the skin gradually loses its elasticity.

As most keloids are painful, itchy and grossly unfashionable, there are several treatments that have the purpose of diminishing the symptoms of this condition and also lighten the scar to make it more like the surrounding normal tissue.

BIO SKIN CARE cream is a topical cosmetic product which not only diminishes the characteristic color pattern of keloids but also helps the body in its self-rejuvenating properties.

It contains biological activators that signal the body's natural healing process as you were 10 years old. This substance along with the body's natural healing power reduces the blemish's visibility overall.

This revolutionary product works for all types of keloids, severity and depth. NO matter how long you have been languishing on that disturbing keloids, the benefits you will gain from the charismatic usage of this product will surely lessen, if not completely remove, that insightful scar away.

Many treatments are available for use in the removal of scar, including surgical removal and laser treatments. But, in many cases they are so invasive that they lately develop in a huger Keloid than was removed.

With these in mind, doctors are now recommending to conduct ear piercing at a younger age in order to minimize the chances of developing some form of keloid scars, and encourage the use of effective topical keloid removing products such as BIO CARE SKIN CARE cream which was effectively formulated to keep that disfiguring keloids away.

new biological natural skin care product that activates skin renewal for a healthy skin.

### **Keloid Removal**

**By Martha Fitzharris**

Not frequently in an otherwise normal wound, the scar develops a tendency to excessive growth. Sometimes, the entire scar is affected; at other times the condition is segmented. This keloid tendency is unexplainable, unpredictable, and unavoidable in some individuals.

There are many ways on how to treat keloids. Though, there are those who do not want to bear the problem anymore, they just decide on whether they want to have it removed. This is because there are instances where keloids continue growing in spite of the fact that the wounds has already healed.

These processes may involve surgeries but it must be kept in mind that keloid removal is not entirely based on the removal process itself. They should be accompanied by some skin care products that

contain natural ingredients.

Today, there skin care products that contain only biological substances, they are responsible in stimulating the formation of collagen in our skin so the natural healing process is done in the affected area.

These kinds of products should be used after keloid removal treatment, this way it will help the skin rejuvenate, start anew and prevent the keloid from creating further damage or irritation on the person affected.

### The Removal Process

For people who have extreme cases of keloid formations, it is best to have it removed through surgery. In this kind of procedure, the specialists use an electron beam radiation, which penetrates deep into the skin but not deep enough to reach the internal organs. This, in turn, will be able to get rid of keloids that tend to obstruct the normal growth of the wounds or skin.

It is recommended to visit a qualified dermatologist, who specializes in cosmetic surgery, so as to ensure quality of operative measures. This is because, keloids may get worsen if the process is not done properly.

Moreover, these professionals have the skills and know the tricks to minimize, if not completely remove scars or keloids. A cosmetic surgeon will often use a row of dissolvable stitches below the surface of the skin and an additional layer of top stitches. The top layer comes out in just a few days, after the skin edges adhere, and the underlying stitches keep the wound closed until it is completely healed.

After the procedure, it is important to maintain the rejuvenation of the skin through skin care products that have natural ingredients or biological substances. This is because the keloids will have the tendency to go back if not properly managed well.

Natural products like the ones that contain elicina or Aloe Vera are much recommended. Both are used extensively to help heal burns and reduce scarring. They contain a number of active ingredients that are useful in wound healing, especially in case of Elicina. It helps reduce inflammation, swelling, and

itching, and it attracts and maintains moisture at the wound or burn site, which also promotes healing.

So, it is best to use natural ingredients so as to minimize further skin problems. This is because skin care products that have natural ingredients are said to be effective and at the same time mild and friendlier to our skin.
