Melita Coffee Makers In Many Forms

By Benny Carlson

Most of us had our first taste of coffee when we were kids. Then, we were so eager to sip our

parent's morning beverage. Infact one of the pranks children love playing is to do exactly the contrary of what they are told is bad. This explains their curiosity and wondering what is in that cup that parents' only want to keep it to themselves.

But I will say that when we finally sneaked behind our parent's to take a sip, astonishing is the right word to describe our feeling– the taste was very awful. We were like what on earth is this? Or is our parents playing a practical joke on us? Because we wondered why all the noise and importance attached to this beverage with a very awful taste.

This was my opinion about the stuff as a kid. Years later, I realized that particular coffee was in reality of an acquired taste. But I am still convinced about my parents' coffee; it was pitiful. People from my era are more inclined to visiting coffee rather than taking the stuff from the drip pot, but this is not to say that the drip pot is out of vogue, because many of them can still be seen and are still in operation at the local malls or kitchen stores. And the more refined breed are known as melita coffee maker.

My first encounter with the coffee machine called melita coffee maker was on the Internet. It was during the period I was browsing for information on a coffee maker because I wanted to purchase one for my mother, and lo a melita coffee site just popped up from the blues.

The first thing I noticed almost immediately was the substantial information they carry on different forms of coffee makers. And this goes to all the young people out there who assumed these are no longer produced due to the craze for coffee houses; your assumption was wrong. Research indicates that multitudes of people, and families throughout the globe still have high affinity for the familiar drip pot coffee maker, and this is often a permanent fixture in their kitchen.

The convenience it offers is another of its strong points, because it saves us the hassles of running off to the local java cafe to have a caffeine drink.

Coffee Maker Types

By A. Pruder

When we hear the term `coffee maker' most of us think of only one type of coffee maker. Most often, the drip style coffee maker or the espresso type machine comes to mind, depending on where you live and your taste in coffee. Of course, the choices vary with the region in which people live also.

One type of coffee maker may be frowned upon in certain parts of the world, while being quite acceptable in another location. Some types of coffee makers are quite antiquated by today's standards, but are still being used by those who prefer the coffee produced.

Such is the case with the percolator style coffee makers. There are two types of percolator style coffee makers, the stove top model and the electric percolator. Both percolators work in the same fashion, which is circulating boiling water over the coffee grounds and through a metal filter repeatedly. Some argue that this makes a good cup of coffee while others say this style coffee maker makes the worst coffee imaginable. The naysayers exclaim the percolator produces a bitter tasting coffee no matter what brand or grind of coffee you use.

The automatic drip coffee maker is by far the most recognized type of coffee maker. This coffee maker produces coffee by heating water in a reservoir which then travels up into a coffee bin holding a filter with the coffee grounds. Then hot water steeps through the coffee and the filter in the bin and drips into an awaiting pot or carafe. These coffee makers usually have a heating element to keep the brewed coffee reasonably hot until the coffee is gone or it's time to brew another pot. Some models come with a thermal style carafe which allows the coffee drinker to brew a pot of coffee right into the carafe for coffee on the go.

Automatic drip coffee makers are the most widely used coffee makers by the American consumer. This type of coffee maker also has the versatility to make from one to usually ten cups of coffee at a time. There are also specialized one cup coffee makers which make use of the automatic drip method. The automatic drip coffee maker uses disposable filters, unlike the percolator style coffee makers.

The espresso coffee maker comes in two versions for the consumer, stovetop and electric. The stovetop model is of course less expensive than its electric counterpart. Another advantage to the stovetop espresso maker is that it is highly portable, unlike the electric model, which is limited in mobility by its size and need of electricity.

One drawback to the stovetop espresso coffee maker is that it may leave bits of very fine powdery granules. This makes the stovetop espresso coffee maker a device that one must master the techniques of using to get a perfect cup of coffee.
