So now we have you pile of images looken real good, nicely organized in directories with an index.htm file, nice. Are we ready to publish this on the net? Well, yes...but. There always is a but. Here are a couple of suggestions that will help you enhance your online photo album.

1)Make sure your album (folders and all) are in the correct location with the website contents that you publish from, usually it is best to create a new folder in the root of the domain that will display the photo album online.

2)Fire up your favorite web editing program. In my case it is Dreamweaver so I will use this program as an example. If you are using GoLive, Front Page or any other web editing program you have to equate it to Dreamweaver's examples.

3)Open the index file. Have a look. If there are any cosmetic changes you want to make do it now. Here is an example of an Adobe Photo album;

http://www.weprintcolors.com/screens/screen_dw_photo_album_sample.htm .

4)Open one html page from the `pages' directory. Have a look. This time what you are looking for is `Global' changes that you would like to make. By global changes I mean changes that can be implemented using the `find and replace' feature. Remember that each one of the auto generated webpages is still basic html. The great part about this is the code is consistent, so find and replace is easy. The first find and place is for `text' only. What we are looking for is improper grammaticism such as .gif or .jpeg appearing in the body. Often Photoshop and Dreamweaver will create this automatically unless you turn it off. If not, no biggy we'll do a find and replace. `Find' the word .gif and replace it with nothing (no value).

5)This one is for the advanced webmaster. Look carefully at an html page within your `pages' directory after you have done your facelift. Create a couple of include files. Plan on placement, sizing, content etc within this page. The reason you may wish to do this is for common footers, banner advertising or any other use you may have to update all files from one. Once you have your webpage figured out, use

the find and replace feature again to place your include files.

6)In the photo album created in Dreamweaver You will notice a line of code that reads as follows (in tags) meta http-equiv="Content-Type" content="text/html; charset=iso-8859-1". You can find and replace this with your Meta tag keywords and description. In Photo shop it looks like this (in tags) META name="generator" content="Adobe Photoshop(R) 7.0 Web Photo Gallery"

Once you have completed your photo album employing the above noted tips you are ready for the search engines to crawl your website and understand your subject matter. Here are a couple of examples of photo albums I have built:

Happy photo album building ;-)

The Best Web Design Programs

The Best Web Design Programs by Maui Reyes

Who doesn't own a webpage nowadays? If you're thinking about spicing up your webpage or (heaven forbid) move your webpage off that blogging host, consider some of these web design programs that will make mastering the art of html a breeze (well, not exactly, but with these WYSIWYG—What you see is what you get—tools, you'll be a designing maniac in no time).

Dreamweaver MX

This is probably the best web design tool. Dubbed as the "Swiss Army Knife" of web developers, Dreamweaver at first could be quite overwhelming. But with a little practice, you'll wonder how you ever survived without it.

Don't let the "flash" and "perl" options intimidate you. What rocks about Dreamweaver is it supports CSS (Cascading Style Sheets), which means you get to preview your work before uploading it. It also integrates seamlessly with other Macromedia products, so if you're a genius when it comes to creating Flash presentations, adding them in would be a cinch.

If you'd like to learn a little bit about html, you can also split the work screen to show the WYSIWYG screen and the HTML encoding (what better way to learn than to see what the code actually looks

like?). If html encoding is your kind of thing, you can ditch the WYSIWYG option altogether. And when you get really good at html, Dreamweaver offers a "code hinting", which displays code options as you type, as well as "Snippets", which is a panel that stores common pieces of html code that you always seem to need.

Dreamweaver generally takes a lot of time to learn, but take heart, Padawan. It's worth the training.

Microsoft Frontpage 2003

For those who love working with Microsoft Office's tools (especially Word), this is the web design program for you.

Its easy-to-use interface makes it easier to access the editing features (unlike previous editions). Just like Dreamweaver, it splits the screen to show the html coding and the site's lay-out. It also features CSS, which means stacking up layers an option. Its Coding Editor also has the Microsoft IntelliSense software, which presents possible choices for the code that you're laying out.

Although not offering as much eye candy as Dreamweaver, Frontpage is perfect for small business and school projects.

Adobe GoLive 6.0

If you swear by Adobe's products, then this is a no-brainer for you. The format is just like any other

Adobe program, so getting familiar with this software will be as easy as pie. It also integrates all the Adobe products in it—you'll get to work closely with Photoshop, Illustrator, and LiveMotion. Which means you get to drag other Adobe files into GoLive. How sweet is that?

But as with any other Adobe program, if you're not familiar with most Adobe products, it needs a little time to get used to. It's quite a heavyweight tool, and if you're not serious about putting up that webpage, you might end up trading in this software for another.
