Reasons For You To Trust A Kohler Engine

By Joe Goertz

If you know about engines then you're probably familiar with the name Kohler, a manufacturer of some of the world's best engines ever invented.

The Kohler Company got its start in the 1920s when it created the Kohler Automatic Power Light 1500-watt Model "A" generator...whew, what a mouthful! The name doesn't quite make it clear what the invention was, but if you haven't already guessed it, it was an engine. This engine was designed to be put to use in rural areas and was powered by a four-cylinder water-cooled engine and could be hooked up to a 120v DC current, a great asset to farmers who lived away from the hustle and bustle of the booming cities.

While this first engine was a mild success, it wasn't until 1939 when Kohler really began to thrive by developing liquid-cooled diesel engines. These engines ranged from single cylinder to four-cylinder, and from 5hp to 20hp. Kohler products were a big part of the war effort against Germany and Japan, which led to huge profits from government contracts.

By 1948, Kohler was beginning to manufacture "stand alone" engines for industrial applications in their first ever engine factory. Three years later Kohler had manufactured the K90 cast iron single cylinder air-cooled engine. By the end of the 1950s Kohler had an entire line of engines, as well as interchangeable parts. There have been no limits for this company ever in its 80 year history.

The list of the engineering accomplishments of this company are many and could be turned into a novel, but suffice it to say that to this day Kohler is still engineering what they believe to be the strongest and most dependable engines in the business, and they also have many satisfied customers who will provide evidence of this fact. And as if this wasn't enough, Kohler also backs its engines with a full lifetime warranty and full after sale service, a practice they have used since their inception into the engineering world.

Kohler still manufacturers a wide variety of engine sizes for all type of uses today. You can find their products in lawn mowers and at construction sites powering generators and other equipment. The horsepower of their engines has not changed much in the company's history, ranging from 4hp to 30hp

today. The engines also come in either air or liquid cooled designs and can meet the application needs of all customers.

Kohler is a company that forms lifelong bonds with its customers, and periodically updates its customers on what's new in the engineering world and what new products Kohler has come out with. Kohler understands that many people put their confidence and trust into their products, which in turn drives them to strive for excellence.

Small Engine; "Some Popular Repower Options for Your Favorite Equipment"

By Ben Anton

Admit it. There are some pieces of equipment in your fleet that you just LIKE. It may be that old Toro Greensmaster that's served you faithfully for years, or the Toro Sand Pro that everyone calls Ol' Sandy. Greens equipment hasn't changed much over the years - whether it's mowers, rakes, or sand groomers, they were good to go when they started, and they still are. The only thing that HAS changed is the engine.

Today's engines are quieter, more fuel efficient and far kinder to our environment. That environment part is important. In some states, fuel emissions are a growing concern - so much so that many have instituted regulations for the amount of emissions that can be sent into the air. Others have set up incentive programs that encourage industry to replace diesel and gas-powered equipment with new, lower-emission equipment. So when Ol' Sandy starts coughing and sputtering when you start her up first thing in the morning, you may be tempted to replace the old girl with something sharp, trim and clean-burning, even though the price tag is staggering.

Don't replace your engine - repower it.

There is another way, though - a way that lets you keep your old faithfuls and still have a more powerful, cleaner and quieter machine, with a price tag that can be as much as 90% less expensive. That option is to repower rather than replace.

Repower, according to one government source, means to replace an old engine with a new engine, a used engine, a remanufactured engine, or electric motors, drives, or fuel cells. It only makes sense - after all, why throw the baby out with the bathwater? Ol' Sandy's engine may be wearing out, but the rest of her is still going strong. Why junk the old girl when you can give her a new motor and have her running good as new?

A Kohler repower kit includes everything you need to get your dependable Toro equipment working better than new. Depending on where you get the kit, you can replace the original 14 hp motor with an 18 hp motor that works harder, quieter, cleaner and for about 20% the cost of buying new.

On top of that, you'll get a full two year warranty on your new engine. And if your state has an Emission Reduction program, you may actually be able to be reimbursed for all or part of the cost of repowering your equipment with a cleaner engine. Check your state's web site for local information, but in most states around the U.S., if the new engine significantly reduces the NOX emissions, you may qualify for grant money to repower with a new Kohler engine.

A Kohler Engine is an original Toro part.

Repower engines from Kohler are specially designed to replace the OEM engine that your machine came with. In addition to the motor, you'll get all the fittings, bolts and Toro parts you need to fit the new engine into your Toro machine.

So if your old, dependable sand groomer, rake, lawnmower, tractor or utility vehicles are becoming less and less dependable, take a serious look at the option of replacing the old, tired engine with a spanking new repowered kohler engines. You won't be sorry.
