As technology continues to develop, life becomes easier and there are more choices. Not only are computers developing at breakneck speeds, but even household appliances such as vacuum cleaners are evolving. Have you even heard of a robot vacuum, well you will soon enough. What are robotic vacuum cleaners, these battery powered creatures roam the floors of your home or office looking for dust and debris. They are designed to make life easier for you by vacuuming any dirt in its path.

Robot vacuums were invented by Electrolux and introduced into the consumer marketplace in 2001, then came Roomba vacuums, they perfected these cordless vacs and took them to the next level. So what can these types of vacuums do for you? Imagine this scenario, you come from a hard day at work, the kids come home with dirt all over their shoes tracking it all over your clean carpets. That would drive most parents crazy, but with the help of the Roomba vac you can read your newspaper and lets the robot do all the work for you.

Your'e probably wondering how this all work? Roomba's vacuum cleaners use a 3 stage cleaning system, that are designed to clean the edge of your walls, under neath all types of furniture and anywhere else it detects dirt. That's right these robots can actually detect dirty areas on your carpet or floor and do extra cleaning in those areas to clean it effectively. And these vacuums actually have a brain, they can detect areas such as stairs and actually avoid them! They use infrared sensors to detect the stairs in your home and stay away from them.

And after the room is cleaned, Roomba goes back to a recharging station to charge its battery for the next time you have a family disaster. You should know that Roomba isn't the only company manufacturing robotic vacuum systems, other models you might want to check out include, Electrolux Trilobite, Karcher RC 3000, EVac and the Samsung VC-RP30W. The most popular of all robot vacs is the Roomba Discovery SE.

Why stress out if you don't have to, let the robots do the work for you. Long gone are the days of vacuuming after the children. Oh, and if you're wondering about the price of a robot vac it will run you about \$350. Check prices out online to find the best deals and cheapest prices on all your cleaning needs.

Robotic vacuum cleaners, sit back, relax and let them do the work

Richard Gazzo is a writer, providing articles on all types of vacuums, such as Miele vacuums, Electrolux vacuum models , Panasonic vacuum. and even central vacuum systems.

## **Carpet Cleaning Machines**

**By Peter Vermeeren**

With the invention of Carpet, the invention of a Carpet cleaning machine was not far away. The first hand held Carpet cleaning machine was designed and tested in the 1860's in Chicago, while the first power operated vacuum machine was invented in the early 1900's by an English man named H. Cecil Booth.

At around the same time as H. Cecil Booth's invention, a man by the name of James Murray Spangler came up with his own vacuum cleaner invention, which he later sold to his cousin Hoover. As you well know, Hoover has become one of the most prominent names in the vacuum cleaning machine business and is certain one of the most popular household names in the western world.

The vacuum cleaner was heralded as a blessing in disguise for many housewives, whose weekly task it was to keep the house clean. Initially, vacuum cleaners were only capable of sucking up dust and dirt, but with modern technology inventors were soon capable of designing a wet-cleaner that can steam carpets and kill germs.

Carpet was capable of covering the floor of a house, flat, or bungalow and keeping peoples feet warm in winter. Initially, people needed to sweep their floors, or carpets, but with the invention of the vacuum cleaner, people could easily detract the dirt and dust from their carpets with less effort. It was also realized that businesses, apartments and corporations would need someone to clean their carpets too, so the invention of the commercial carpet cleaners was next.

Essentially, the vacuum cleaner operates using a pump system. The pumping device sucks up air from a house, which in turn sucks up the dust and dirt from anything in front of the house opening. Inside the vacuum cleaner is a filtering system that collects the dust and dirt that can later be placed in the garbage outside.

Currently there are seven main types of vacuum cleaners; the upright vacuum cleaner, the Canister vacuum cleaner, the back-pack style vacuum cleaner, the built-in vacuum cleaner, the robotic vacuum cleaner, the hand held vacuum cleaner and the wet/dry vacuum cleaners. These different types of vacuum cleaners are available in different styles, sizes and have various voltage/power potentials.

One of the most significant developments in carpet cleaning machines has been the invention of the cyclone carpet cleaner. Unlike previous carpet cleaning machines, the cyclone carpet cleaner collects dust and dirt in a large cylinder type container. The cyclone carpet cleaner operates using a central air force and a number of filters. These filters filter the dust and dirt into stages, so that the air being sucked up into the cylinder container can then be cleaned and re-released into the air through a central

outlet.

Robotic vacuum cleaners are also a relatively new invention, enabling the carpet to be cleaned by a carpet cleaning machine without the need of people power. Using a simple control mechanisms, the robotic vacuum cleaner can navigate its way around the floor of an apartment, or home, cleaning dust and particles from the floor and then return to its docking station for re-charging.
