SEO Techniques

By Mehul Vyas

1. We will start with the Meta Tags. I know you have already heard of, and are probably currently using meta tags on your site. This is great. I just want to make sure you are using them effectively. We will only go over 2 tags: the "title" tag, and the "description" tag. We will not go over the "keywords" tag, as the major search engines have placed less and less weight on this one, and some would argue this tag has no weight at all. I still use this tag however, as I feel there is some merit and no drawbacks to using this tag.

I have found it effective to use similar text in the "title" and "description" tags, and to place your keywords prominently in these tags (near the beginning and more than once). I have seen sites with "sitename.com", "New ", or "Welcome to my site" in the "title" tag, which really does not help in their quest for higher rankings for their particular keyword. Also, try not to use words such as "and", "or", or "the" in these tags.

2. Important note about your keywords. Search engines evaluate keyword prominence, keyword weight, and keyword density when determining a site's ranking. All three are calculated individually for the page, the title tag, the description tag, as well as other areas on a page. Keyword prominence means how close the keyword is to the beginning of your page. Keyword weight refers to how many times a particular keyword or phrase can be found on the page. Keyword density is the ratio of the keyword to the other words on the page. You do not want the keyword weight or density to be too high, as this can appear to the search engine as "keyword stuffing" and most search engines penalize sites that stuff their keywords.

3. Place your navigational links (and JavaScript) at the right or at the bottom, but not on the left, of the page. When the search engines "read" your site, they read from the top left to the bottom right. Search engines place an emphasis on the first 100 words or text on the site. You do not want these words to be navigational links or Javascript. Ideally, you want to have your heading tags with your keywords in the beginning of your page. This being said, placing your links/Javascript on the right or bottom of your page ensures the search engine spiders get to the text first, giving more weight to what's important on your page.

SEO Techniques

4. Place alt tags on all of your images. Search engine spiders cannot "read" pictures or images. The only way a spider knows what an image is about is by reading the alt tag. This is also another chance to place more of your keywords in your HTML, improving your page's keyword weight/density. Alt tags are easy to make and they can make a big difference in your sites keyword ranking. A simple alt tag looks like this: alt="put your keyword phrase here." Search engines separately calculate keyword prominence, density, and weight in alt tags as well, so optimize your tags.

5. Place your keywords at the bottom of your page. Just as search engines place more weight on the first words of your page, they also do the same to the last words. The general thinking is this, if your site is about a certain subject, then the main points, or keywords, should, appear at the beginning, be spread throughout the page, and be prominent at the conclusion. But if you have all of your navigational links and JavaScript at the bottom, your relevant page text could end well before the HTML does. An easy way to have your keywords at the bottom of your page is to include them in the copyright information. For example, if you have a dog food website, you could have something like this

at the very Search engines are not (as of this writing), penalizing sites using this technique, and it wouldn't really make much sense for them to do so.

6. The Anchor Text of your links. Anchor text is the actual linking text on a site. It is what the user clicks on to navigate to that particular site or page. If a search engine finds many links to your site using the term "dog food", then the search engine concludes your site is about "dog food". This is overlooked quite often, but it seems to have a very large impact on your search engine rankings for a particular keyword. Your anchor text needs to be the keyword or phrase you are trying to target. Try to avoid anchor text such as "Click Here" or "yoursite.com"

Also, if you're running a reciprocal link campaign, be sure to use variations of your text. If an engine notices every link to your site is identical, it could place less weight on these links or potentially penalize your site. This is because search engines generally give more weight to "naturally occurring" links, and less to "reciprocal link exchange campaigns". Using different, but relevant anchor text can dramatically affect your targeted keyword rankings, by making your links appear more natural.

Effective SEO may seem difficult at first, but as you have read above, little tricks that require little or no programming knowledge, can make a huge impact on your website's keyword ranking.

SEO – Search Engine Optimization You Can Do

By J. Ratliff

SEO – Search Engine Optimization You Can Do by J. Ratliff

We all know what SEO is, and it seems like it has kind of an "executive" sound to it doesn't it? The truth is, thousands of webmasters spend millions of dollars every year on SEO services. Now, I am not discounting the importance of these services.

Indeed, SEO is very important not only to the big website portals, but to your website as well.

However, I do believe that a lot of the people who spend thousands annually, do so without needing to. I have done SEO work on a dozen websites for businesses, and about 20 of my own. My secret? It's all in the software.

If you have not checked out this software, I highly recommend it.

Internet Business Promoter

(IBP) for

short. I use it everyday, not only for my websites, but also for any SEO work I do.

It does cost around \$200, but it is worth every penny plus some.

Save money and do your own SEO work.
