Shall we grab the Oil Fields.

By Robert Maegh

After the fall of the Ottoman Empire, the Western-Nation-States artificially constructed the countries that form now what we Westerners call the Middle East. At the same time was decided that the West would leave the natural resources to the respective countries. Now, in the 21st century, one can ask oneself if this was the right decision.

First observation: the Muslim world hates us. Why do they hate us?

I can only see the following reasons:

- They are not yet recovered from the fall of the Ottoman Empire.
- They are still dreaming about the Caliphate of the 7th and 8th Century and want to establish a new flourishing Caliphate ruling the whole world.
- The Muslims hate us because we support the Jews. Why do they hate the Jews? They hate them just because they are Jews and the Prophet has told them to hate and kill the Jews.
- The same can be said about the Christians and the Westerners in General. They hate us because we are infidels and because the Prophet had told them to slaughter the infidels unless they convert to Islam.
- They find our society decadent, materialistic and perverted. Here I must admit that I look with disgust to some aspects of our society.

Can this attitude of hate towards us be changed?

I don't see any change possible in the near future and for the following reasons:

- Muslim don't have the broad view on the world as we have. The ancient Greeks, the Romans, Christendom and all Western philosophers have influenced us and we have learned to accept opinions different from ours. We started thinking rational and developed sciences. Muslims on the other hand, only study Islam, most graduates from University have degrees in Islamic science. A larger part of Muslim population is still illiterate and accept blindly what the Mullahs say.
- Concerning religion, Judaism and Christendom have consistent stories in the Holy Books and these stories are understandable for everyone who reads them. The Koran however is a collection of verses, sorted by verse-length (the longest first). There is no consistent story and this makes the book very difficult to read (try it!).

Now about the oil. Will the House of Saud fall? Yes it will fall. The only questions are when and who

Shall we grab the Oil Fields.

will follow up. When we are not watchful, it will be the forces that are actually trying to undermine the Kingdom: the Muslim Fundamentalists like Osama Bin Laden and the Wahabists. What will happen when the oil fields are coming in the hands of extreme Muslims?

– As they are only concerned with religion, they might destroy all the installations, including these of the Emirates.

– They could close the valves towards the West or ask prohibitive prices (Bin Laden's dream: \$144/barrel).

When Extremists take over the oil fields, the future doesn't look bright for the West and this would bring us in an unimaginable economic depression. At that moment, they have the best cards: or they stop the deliveries to the West, or they destroy the installations. Both actions are a real doom–scenario for the West.

What is Wisdom? Shall we grab the oil fields before it is too late? What consequences would this have on the world–situation? Is the West capable of doing it?

We can do it, we have the technology and the military power. It must be a short very accurate action, not giving the enemy the chance to react. There are however other aspects that also must be considered. It must be a secret action, and at the same time accepted by the complete West (including Russia and Japan). Must China be informed with the guarantee that their oil deliveries will continue at reasonable prices. How will China react?

During the Reagan administration, there has already been a computer simulation of such an action.

This was however a "Cold War" situation, not longer applicable for our situation.

Can we do the same exercise with the Kaspian oil and gaz fields?

Again, what is Wisdom? What is the best thing to do, to guarantee the continuation of our Civilization? I do not know, but I think some action is necessary and there is not much time left.

Robert Maegh is a Belgian engineer, born in Germany in 1945. He spent several years in Africa and the Middle East. "A Holy Terror" is his first novel and a sequel can soon be expected.

Little–Known Way To Save Money On Your Car Oil!

By "Dr. Drew Henry"

Imagine if you could save anywhere from \$10 to \$20 dollars on your usually very expensive oil change doing something very simple. Interested?

Here's how: Every 3000 miles completely drain out and replace the oil in your vehicle... by yourself! Just by doing this, you can save anywhere from \$10–\$20 dollars on your oil change. Below are the steps you can take to drain your car oil:

Note that when changing the oil on your car you need to prepare with some supplies. You will need the

Shall we grab the Oil Fields.

following: Jack, the correct size wrench or ratchet, oil filter, oil, short bucket, rag, funnel, and a big piece of cardboard.

Start by warming up your vehicle. Drive around the block once or twice, which will heat up your engine a little bit. A vital part to changing oil. The oil must first be warmed up otherwise you will have trouble getting it out. Then, jack up your vehicle, being sure to follow all safety precautions. Make sure to find a strong point on the bottom of your vehicle before jacking it up. An axle is the best place. After making sure everything is secure you are ready to get down and start the dirty work.

The first thing to do is to drain out all the old oil. Look under your vehicle and locate the oil drain, which is usually one of the only 'plugs' in view. Generally this plug will be located right around the middle of the engine.

Then, place your big piece of card board under the vehicle, which will keep you off the ground and also serve to catch any oil that drips. Grab your short bucket or container and place it under the vehicle, just below the oil plug. Once the bucket is in place take your wrench or ratchet and unscrew the oil plug slowly, letting the oil drain.

Give the oil time to drain into the bucket, waiting till it comes out in slow drops. Then, carefully unscrew the oil filter. As you remove the filter, a short stream of oil may come out. Be sure to catch this in the bucket while not burning yourself. After you have drained all the oil out of your engine you will need to replace the plug and add the new oil filter. Once you've finished that, be sure to clean up any messes that were made with your cleaning rag.

When you're done cleaning up, you can start putting in new oil! Find out how many liters of oil your vehicle takes and pour it in with the funnel through the spout labeled for oil on top of your engine, beneath the hood of your vehicle. Use the dipstick to check and make sure the oil level is high enough. Once the tank is full put all caps back on and close the hood.

Be sure to properly dispose of all the old oil and the oil filter. And guess what? You've just saved \$10–\$20 by changing your car oil yourself... and it doesn't seem too hard, right?
