The Benefits Offered By Bladeless LASIK Eye Surgery

By Jimmy Roos

The risks involved in LASIK eye surgery is relatively small compared to other types of surgery.

However, there is still a risk which is there because of the use of the blade that is used to cut the flap in the cornea. The use of this blade comes with the element of human error. This is because all human beings make mistake from time, although this risk is reduced the more highly trained someone is. However, this risk is still there.

Bladeless LASIK lowers that already small risk even further as it removes the need for a blade. This function is taken over by IntraLase lasers which are controlled by computers and can therefore provide a more precise cutting action. Because bladeless LASIK is so delicate that it can even be used on people who have thin corneas. These are people who usually not approved for other types of laser surgery.

Bladeless LASIK offer a number of advantages. The IntraLase laser used during bladeless LASIK allows for an increased curvature, hence lowering the margin of error even more. The fact that a laser is used instead of a blade leads to less infections and irritation. Not only that, bladeless LASIK only leads to a shorter recovery period compared to other types of LASIK eye surgery.

Before bladeless LASIK, many people who had surgeries had to come back for follow-ups or to redo a surgery that didn't go so well. There is also a great deal of irritation that follows other surgeries. However, with bladeless LASIK most of these are something of the past, because of a success rate that is very close to 100%.

So now you may wonder, why do we need an eye doctor for if the lasers are doing everything? Well even though many of the actions are controlled by lasers, these lasers still have to be directed. And to be able to do that you need to have the knowledge of both laser technology as well as eye surgery, which only a trained LASIK eye surgeon can give you. Surgeons who do bladeless LASIK now also need to know how to operate the computer that controls the InterLaser lasers.

Although bladeless LASIK may cost a bit more, many people think it is worth spending that extra money, considering the near perfect results you get. Not to mention the reduced irritation and shorter

recovery time.

Educate Yourself – LASIK Eye Surgery Could Be For You

By Nicola Kennedy

It might be the case that you are tired of wearing glasses, or you believe that it cramps your style. You also don't want to use contact lenses, in order to avoid infection or inflammation due to overuse. In such a scenario, you are likely to consider LASIK eye surgery, which is one of the most prevalent vision correction procedures. And therefore, you require some basic LASIK education, in order to get a clear picture of what you can expect from LASIK if you want to know whether you should do eye laser surgery.

If the light rays don't focus on the retina (light-sensing cells), the image you see is blurry. This is termed as refractive error, and may be caused due to an irregularly shaped cornea. LASIK surgery involves carving of the cornea in order to give it the perfect shape, thereby making light rays focus on the retina. LASIK surgery employs a high-precision laser, named Excimer, which is an ultraviolet chemical laser.

Scads of people have undergone LASIK, and most procedures have been successful. But as with any surgery, LASIK has associated risks and complications. However, LASIK has a relatively low complication rate, between 1% and 5%, which is among the lowest in the eye surgery field. Another trivia from the chapter on LASIK education is that LASIK may not result in perfect vision. That is, not all patients achieve a 20/20 vision.

If you suffered from myopia and have undergone LASIK as a corrective procedure, you would still require reading glasses (for near vision) in your late 40s. LASIK is an irreversible procedure, and most insurance companies do not cover LASIK surgery. Therefore, make sure that your surgery is performed by an experienced ophthalmologist. Also note that only eye MDs (ophthalmologists) are permitted to perform LASIK surgery.

Now that you are aware of the ins and outs of LASIK surgery, decision making is much easier. Have a discussion with an experienced ophthalmologist. It might be the case that you could very well forego the surgery. But if need be, LASIK is a superlative option to correct your vision.

Nicola Kennedy publishes articles and reports and provides news, information and views about whether

you should do eye laser surgery
