The Dangers Of Household Garbage

By MalaMaal.com

The Dangers Of Household Garbage

Reducing the hazardous waste in America's landfills starts at home. Millions of households are producing billions of pounds of solid waste. Products used every day in our homes leach hazardous chemicals after entering landfills. There are a number of simple steps that average consumer can take to limit the damage that many of these toxic materials are doing to the environment.

The garbage situation has become a big concern in cities all around the country and not only is this a political issue, but it is also a problem that has caught the attention of the general population. We all realize there is a growing problem but nobody likes to admit that their garbage is contributing to the problem.

Many municipalities have already started a recycling program to deal with the growing mountains of paper, plastic, glass, etc. Although it takes a bit of effort on the part of the public to sort and separate their garbage, people are now beginning to realize that the future of our environment is at stake.

One household product that is causing a problem these days is throwaway batteries. Each year, Americans throw away 84,000 tons of alkaline batteries. These AA, C and D cells that power electronic toys and games, portable audio equipment and a wide range of other gadgets comprise 20% of the household hazardous materials present around the country in America's landfills.

When a battery in one of the products we use fails, we simply run out and buy a replacement. The dead battery ends up in the garbage and no one thinks about where it goes and what happens to it after the garbage is picked up.

Sealed inside these alkaline cells are harmful materials which are not encountered by consumers during normal use. However, when the batteries enter a landfill, the casings can be crushed, or can easily degrade, which causes mercury and other toxins to leach into the environment.

The problem of batteries in landfills is one of the easiest to solve. Using rechargeable power can significantly reduce the number of batteries which end up in landfills. Rechargeable batteries can be

The Dangers Of Household Garbage

used again and again, up to 1,000 times. One rechargeable cell can replace up to 300 throwaway batteries, keeping the landfill free not only from the batteries themselves, but also from the paper and plastic materials that are used to package them.

There are a number of manufacturers in the country today who deal in rechargeable products and some of them have a number of programs already in place to ensure that rechargeable batteries never enter a landfill at all. For example, one of the largest manufacturers of rechargeable products is now offering a lifetime replacement guarantee on all round cells. If the product ever fails to accept or hold a charge, the company will promptly replace it and recycle the used cell.

If you have an environmental agency in your area, you might like to work on this issue with them, or perhaps they already have a program set up to dispose of used batteries. As a concerned citizen, your suggestions and input will be invaluable to them as they attempt to come up with some solutions.

Kitesurfing dangers

By Jakob Jelling

Kitesurfing dangers by Jakob Jelling

Kitesurfing is a very dangerous (or, as some people call it, extreme) sport. Before you try kitesurfing, you should definitely try to find out about all the potential kitesurfing dangers. The kitesurfing dangers may result from many different things: from equipment failure to human mistake to problematic weather conditions. Learning about the potential kitesurfing dangers will help you to prevent yourself from getting into dangerous situations and making dangerous mistakes.

Of course, there are very good safety systems available to prevent many kitesurfing dangers but these safety systems cannot protect you from every single danger. You will need to make sure that your equipment has a very good and reliable safety system and that you know how to use it and are comfortable with it. Practice using your safety system as much as you can. Also, make sure to study the safety systems guidelines provided by the manufacturer. If money is not an issue, try to purchase the best safety system available of the market.

Bad weather is probably one of the most important kitesurfing dangers, so try to make sure that you kitesurf only when the weather is good and there are no apparent dangers present. Also make sure that you know the weather forecast, since a sudden weather change can be very problematic. The kitesurfing dangers, including the bad weather danger, and present both when you are in the water and when you are on the surface. According to West Australian newspaper, the most dangerous time for a kitesurfer is when you are on the land because the equipment is designed for the water.

You should also be able to get the detailed operating instructions from your kite's manufacturer. To prevent the potential kitesurfing dangers, make sure that these instructions describe in details the specific techniques for launching and landing your kite and other techniques.
