What Can Far Infrared Water Filtration Systems Do For You?

By Nick Wright

With the ability to clean the water and enhance its structure, far infrared water filtration (FIR) has

some consumers wondering if this may be the blessing in disguise they've been waiting for. With our body being made up of over 70% water, simply removing contaminants isn't good enough anymore, considering the level of today's knowledge and technology. Far infrared water filters claim to provide consumers with the opportunity to deliver clean water that is refreshing crisp and energized to boot.

Far infrared rays are the invisible portion of the sunlight spectrum that has been found to promote growth and health to living cells in plants, animals, and humans. By using a far infrared water filtration system, some have estimated an enrichment of treated water that somehow strengthens various organs within our bodies.

It is vital that all drinking water filters detect and decontaminate any sort of impurities that may be found in our water. However, above and beyond this standard requirement, some also crave the ability to enhance the water's structure and properties. By doing so, far infrared water filtration may allow us to drink energized water while getting superior hydration; all in the name of improving overall health.

So how does it work you may ask? Far infrared rays are reported to have the ability to penetrate the human body in order to activate cells. With continuous movement, the rays are alleged to reactivate cells to help strengthen the micro-circulatory system. The micro-circulatory system is often the cause of various ailments. By strengthening this system, some may reduce or even reverse ailments that have plagued their bodies for years.

There are several effects far infrared rays can have on our body, all of which can have a strong positive effect when used as a far infrared water filter. Theoretically, the water filter will soften hard water, eliminate offensive odors, and destroy any potentially harmful contaminants. FIR could also be shown to prevent bacterial growth, be used to purify the air, or prevent mould from occurring. As far as our health goes, FIR may also regulate the blood flow, increase resistance against various diseases and balance the acidity levels in our bodies.

What Can Far Infrared Water Filtration Systems Do For You?

While empirical evidence to back up this technology is sketchy at best, many people swear by far infrared water filters. Not only do these types of filters claim to be able to eliminate harmful contaminants and bacteria, but they also claim to enhance your health and even slow down the aging process. Another claimed benefit is that through the warming and eliminating of fats and chemicals in your body, this technology is able to reduce or even eliminate certain types of circulatory problems. With these kinds of benefits being touted, it is no wonder that consumers are taking advantage of the far infrared water filtration system. The real question is; will FIR filtration systems work for you?

Caveat Emptor...

Catalytic Water Filtration – How To Extend The Life Of Your Water Filter

By Nick Wright

If you are tired of continuously having to change your water filter then wait until you read about the catalytic water filtration technology. The catalytic filter was developed with the intent of decreasing the rate of contamination buildup on the filter surface itself. This will allow you to decontaminate your water and get long use out of your catalytic filter at the same time.

Many water filters are great and get the job done, but how often are you replacing your filter to get continuous fresh water? That is what separates the catalytic water filtration system from the rest. You obviously still have to change your filter from time to time, but you can get further use from the filter while maintaining a fresh water base at the same time.

Another advantage to the catalytic water filtration system is there is a decreased shedding of contaminated particles that come from the filter's surface. This will keep the water even fresher and allow the filter to hold up longer before becoming contaminated. It is able to decrease shedding of contaminated particles because of its ability to withstand a normal water filter's long term effects.

As the catalytic water filtration breaks down the contaminants at a much more aggressive rate than normal water filters, it leaves far fewer bacterial nutrients allowing the filter to last longer. The catalytic filter is further enhanced when it is exposed to UV and ozone, breaking down contaminants quicker and even more affective.

The great thing about catalytic water filters is their ability to purify water in all places of the house. It is not specifically for purifying tap water into clean drinking water. It isn't just made for giving you a more refreshing shower. Catalytic water filtration can be used for all aspects of your house that has water.

What Can Far Infrared Water Filtration Systems Do For You?

As of now, you can place the catalytic water filtration technology in almost all water treatments. The potential is there for the technology to soon be used for new water treatment systems along with existing water systems. As soon as the catalytic water filtration is capable of working with all water treatment systems, the water filter industry could forever change.

There are several water filters in the environment that can be used to purify all kinds of water, but the newly developed catalytic water filtration has raised the bar. While it is still in development to be able to use with all filtration systems, the catalytic water filter is technology that will increase the life of your filter and enhance the quality of your water all in one system.
