## What Is Breast Augmentation?

By Heather Colman

Breast augmentation, also known as breast implant surgery is a popular cosmetic surgery to

enlarge the size of a woman's breasts or to reconstruct the breast to correct genetic deformities or after a mastectomy. This procedure is also performed during male-to-female sex changes.

How popular is breast augmentation? According to the American Society of Plastic Surgeons, breast augmentation is the third most commonly performed cosmetic surgical procedure in the United States. In 2005, 291,000 breast augmentation procedures were performed.

There are four types of implants used in breast augmentation.

1. Saline implants, which have a silicone rubber shell filled with sterile saline liquid. These implants are currently the only type available outside of clinical trials in the United States, but future regulation may make more filler types available.
2. Silicone gel implants, which have a silicone shell filled with a viscous silicone gel.
3. String Implants, which used polypropylene (PPP), were eliminated years ago by the U.S. Food and Drug Administration (FDA) due to the complications brought about by continuous growth after implantation.

Despite the apparent danger and frequent complications, this type of breast implant was popular among adult entertainers.

4. Tissue engineered implants are a new form currently in development. Cells taken from tissue artificially grown from human stem cells are combined with a scaffold material to produce a Tissue Engineered Breast Implant.

The advantage of this breast augmentation method is that there is no risk of leakage or rupture, and the size can remain stable for the lifetime of the patient, a contrast from the silicone or saline filled implants which typically reduce by approximately 40%.

## What Is Breast Augmentation?

Regardless of the type of breast augmentation procedure chosen, it is likely that women with implants will need to have one or more additional surgeries (reoperations) over the course of their lives. The most common reasons for reoperations include cosmetic concerns, capsular contracture, and rupture.

Reoperation rates are less frequent in breast reconstruction cases. The major implant manufacturers, Mentor and Inamed, both reported that almost half their reconstruction patients underwent additional surgeries within three years to fix implant problems, whether their implants were silicone or saline.

### **Under The Arm Breast Augmentation**

**By Jim Glu**

Under the arm breast augmentation helps increase the size and shape of the breast. Women undergo this under the arm breast augmentation for several reasons.

The breast augmentation surgery helps make the breast in correct shape with the body and gives self esteem to them. It even reduces the volume of the breast after pregnancy. The breast augmentation enlarges or reshapes the breast, which has lost its original shape due to breast feeding and aging. Under the arm breast augmentation involves the placement of saline behind the breast tissue or under the chest wall. It is similar to the method of breast implantation. But the reasons differ. The women with shapeless breast can readily opt for this method. Before the under the arm breast augmentation, initial consultation must be done with reputed plastic surgeon, certified by the American Society of Plastic Surgeons. They will examine the women's health fully and apply the suitable surgical techniques, according to their health condition.

Women opting for under the arm breast augmentation must explain about the drugs or other medicines she is taking. Most importantly smoking women must tell her surgeon about her smoking habit. Since smoking could delay the process of healing and may result in other complications. Surgeon will choose other alternative. The under arm breast augmentation can give a more positive self image.

The under the arm breast augmentation is done under general anesthesia. A small incision is made under the breast or under the arm and a saline implant is gently inserted under the breast tissue with

the help of elastic bra, the breast position is corrected. Initially it will create some discomfort, but it can be controlled with oral medicine. The sutures are removed in 7–12 days.

Normally implants used for under the arm breast augmentation are smooth shelled. It gives a perfect womanly look. Implants can be placed to the patients' wish. It can be placed under the arm endoscope method around the incision of about 3 to 4 centimeter. The under the arm breast augmentation can provide a full, perfect shape to the breast. It is 100 per cent safe. It enhances the feminine curves and increases the self confidence. The cost is affordable and price worthy for the surgery which is going to provide self dignity. Side effects are rare. It can be either swelling or bruising. But, it will decrease within few days. Under the arm breast augmentation is not painful. The patient can perform her routine activity within 3–4 days.
