Winter Car Care Tips

By Norman Fleming

The cold weather affects your car too. Along with making driving more hazardous due to ice and snow, extreme winter weather can be stressful, especially on older cars.

As winter approaches take your car to your trusty mechanic and have him check the following items: battery, wipers, antifreeze levels, heating system, brakes, defroster.

You'll want to make sure your battery is fully charged as cold weather starting is a heavy drain on your battery. You'll want to make sure that your windshield wipers are in good condition as they'll get a lot of use brushing snow off, and, make sure you have plenty of windshield washer fluid in the reservoir and carry an extra gallon in your car. Your windshield washer fluid will get used up quickly keeping salt off the windshield. You will want to make sure that your antifreeze is at proper levels. Antifreeze can prevent freezing of your engine to about 30 degrees below zero. It should be replaced every two years. Have your heating system checked, this will include your defroster, which you'll really need during the winter.

Make sure you have good winter tires on your car. If you live in an area where you get a good amount of snowfall you may want to make a seasonal change from all season to snow tires. All season radials just don't give you the same performance in snow and ice that dedicated snow tires do.

There are things that you should keep in your car during the winter. Snow scraper, deicer, blankets, extra hat and mittens, small snow shovel, sand (to help with traction), boots. At all times you should have a small first aid kit, booster cables, small tools such as screwdriver, wrench and pliers a flashlight with extra batteries, extra water. Keep a can of deicer in your home so you'll be able to get into your car.

Remember before leaving home to make sure your car is completely cleaned off. Clear all snow and ice from your hood, roof, trunk and side. Make sure your headlights and tail lights are clearly visible. Drive slowly. The posted speed limits are for ideal driving conditions. When driving leave plenty of stopping distance between you and the car in front of you. You may need to leave more distance in icy conditions. Make any turns slowly. Brake slowly.

Winter Car Care Tips

By following these tips above you can have a safe winter driving season.

Body Care

By Kevin Schappell

The winter months can be tough on your body... your car body that is. Salt and chemicals used in the colder climates can wreak havoc on your cars precious sheet metal. By doing a few simple things this winter, you can keep your car's body looking it's best.

Put a good heavy coat of wax on your car before the winter storms hit. This heavy coat will protect your paint from the corrosive salt and cold temperatures.

Wash the underside of your car often during the winter months. Salt and chemicals will collect under the vehicle and slowly start eating away at your car.

Skip the undercoating unless you are buying a new car. Applying undercoating after a car has been on the road for a year or two is pointless. The metal has already started to rust and there is bound to be water stuck in places it does not belong. Once you undercoat, you trap that water or rust and allow it to destroy your car.

Avoid driving through large puddles of standing water. This water is loaded with salt and will get thrown into all the cracks and crevices of your car.

When springtime rolls around, treat your car to a good wax job again. Make sure to get all of the road grime and salt off of the car before you begin waxing.

With proper care and love, your body will stay in shape for years to come.
